

# Lindab **Zinc-Magnesium Duct System**

Technical information

# Duct system of Zinc-Magnesium ZM 310

## A corrosion-resistant duct system for high environmental requirements

### Products

The purpose of this brochure is to present which of Lindab's duct system products that is available in the Zinc-Magnesium coated steel sheet material. More detailed technical information about the system and the products can be found in our brochure "General Information and Theory" or the product's website. Zinc-Magnesium products are usually handmade instead of pressed and can therefore differ from the standard galvanized assortment in size and weight.

### The circular duct system

The circular system is part of the Lindab Safe range and is manufactured as standard with a double lipped gasket made of EPDM rubber. The standard dimensions are adapted to EN 1506, which is made with over bent edge, which provides excellent structural stability and increased durability against damage caused by handling. For chemical environments other than EPDM gasket can withstand, see also how our silicone gasket is performing in the brochure "General Information and Theory". The products can also be obtained without gasket if none of our gasket options meet the requirements.

### Material description

Zinc-Magnesium is a zinc-Magnesium coated steel sheet that can be used unpainted up to corrosive class C5.

See table on next page for information about corrosive classes.

The alloy of the metal coat has a weight percentage of 3% Magnesium, 3,5%aluminum and 93,5% zinc with a coat weight of 310 g/m<sup>2</sup> per double side.

### Appearance

The surface is initially glossy metal with a rose pattern but after some time it turns greyish, and eventually it becomes matt grey.

### Sheet steel properties

Zinc -Magnesium coated steel sheet ZM310	According to SS-EN 10346:2015
Fire Resistance Classification	A1 (EN 13501-1)

### Lifetime

The layer of Zinc-Magnesium has a thickness of approx. 24 µm (0.024mm) per side and can in some cases be an alternative to stainless steel.

Due to corrosive and appearance related reasons, the following combinations should be avoided to prevent them from affecting the aesthetic and technical lifetime:

- Zinc-Magnesium in combination with copper, brass or lead can cause galvanic corrosion. Avoid drainage from constructions and roofs that contain these metals. In particularly aggressive environments.
- Zinc-Magnesium in contact with highgrade woods, damp wood or wood with waterproofing containing copper can cause black rust or corrosion.
- Zinc-Magnesium in combination with bitumen products without a UV stabiliser.
- Zinc-Magnesium in combination with wet concrete, cement and plastering that are very alkaline can cause discolouration or black rust.

### Trimming edges

Corrosion on the edges can occur in environments that are exposed to corrosion and in which the edges of the sheet are exposed. Normally, the trimmed edges do not need to be painted with a protective paint. Protective paint can be applied in environments in which the trimmed edges are aesthetically prominent.

## Corrosion

Zinc-Magnesium has an ability to repair itself which makes the material resistant to corrosion caused by scratches.

The long lifetime is due to the fact that the zinc-Magnesium coating provides the steel sheet with a double protection against corrosion. The first protection factor is the coating on the steel sheet that forms a passivating barrier against general corrosion. The other protection factor involves the formation of a galvanic element when the sheet is exposed to moisture (electrolyte), resulting in zinc ions flowing over and protecting the exposed steel against corrosion in scratches or trimmed edges.

## Corrosive Class

Zinc-Magnesium can be used up to corrosive class C5 in accordance with EN ISO 12944-2.

## Environment

The long lifetime of Zinc-Magnesium, in comparison with for instance hot dip galvanised sheets, entails major environmental benefits. There is a worldwide infrastructure for recycling steel that works well. Once steel is produced, it is part of a constant cycle as steel always contains recycled materials. Steel is always 100% recyclable, the metal layer does not pose any problems for remelting.

## Eurovent certification

Lindab's circular duct system with rubber gasket connections Lindab Safe and Lindab Safe Click is certified to strength and leakage in tightness class D according to the Eurovent Certified Performance program for circular metallic ducts systems (DUCT-MC). Check ongoing validity of certificate:

[www.eurovent-certification.com](http://www.eurovent-certification.com)

The purpose of Eurovent third party Certification is to create a common set of criteria to all relevant features for the rating of products in this system and ensure the constancy of performance over time.

Through specification of products in Lindab's certified system, Lindab Safe and Lindab Safe Click, the engineer's tasks become easier, since there is no need to carry out detailed comparison and performance qualification testing. Consultants, specifiers and users can select products with the assurance that the catalogue data are accurate to a certain level.

Lindab products that are Eurovent certified have the Eurovent logotype in the footer of the technical documentation.

Note: Most Lindab Safe and Lindab Safe Click and the most commonly used product in a ventilation system are essentially better than class D, however some products are according to EN 15727 not class D as a single product. These products are stated in the documentation as Class C and can be used in D class systems to a limited extension.

## Corrosivity classes according to ISO 12944-2 with environmental examples

Corrosivity category	Corrosivity	Examples of typical environments (informative only)	
		Exterior	Interior
C1	Very low	-	Heated buildings with clean atmosphere, e.g. offices, shops, schools, hotels.
C2	Low	Atmospheres with low level of pollution: mostly rural areas.	Unheated buildings where condensation can occur, e.g. depots, sports halls.
C3	Medium	Urban and industrial atmospheres, moderate sulfur dioxide pollution; coastal areas with low salinity.	Production rooms with high humidity and some air pollution, e.g. food-processing plants, laundries, breweries, dairies.
C4	High	Industrial areas and coastal areas with moderate salinity.	Chemical plants, swimming pools, coastal ship and boatyards.
C5	Very high	Industrial areas with high humidity and aggressive atmosphere and coastal areas with high salinity.	Buildings or areas with almost permanent condensation and with high pollution.
CX	Extreme	Offshore areas with high salinity and industrial areas with extreme humidity and aggressive atmosphere and subtropical and tropical atmospheres.	Industrial areas with extreme humidity and aggressive atmosphere.

## Good Thinking

**At Lindab**, good thinking is a philosophy that guides us in everything we do. We have made it our mission to create a healthy indoor climate – and to simplify the construction of sustainable buildings. We do that by designing innovative products and solutions that are easy to use, as well as offering efficient availability and logistics. We are also working on ways to reduce our impact on our environment and climate. We do that by developing methods to produce our solutions using a minimum of energy and natural resources, and by reducing negative effects on the environment. We use steel in our products. It's one of few materials that can be recycled an infinite number of times without losing any of its properties. That means less carbon emissions in nature and less energy wasted.

**We simplify construction**
