

## Lindab **Aluminium-zinc Duct System**

Technical information

# Duct system of aluminium-zinc AZ 185

## A corrosion-resistant duct system for high environmental requirements

### Products

The purpose of this brochure is to present which of Lindab's duct system products that is available in the aluminium-zinc coated steel sheet material. More detailed technical information about the system and the products can be found in our brochure "General Information and Theory" or the product's website. Aluminium-zinc products are usually handmade instead of pressed and can therefore differ from the standard galvanized assortment in size and weight.

### The circular duct system

The circular system is part of the Lindab Safe range and is manufactured as standard with a double lipped gasket made of EPDM rubber. The standard dimensions are adapted to EN 1506, which is made with over bent edge, which provides excellent structural stability and increased durability against damage caused by handling. For chemical environments other than EPDM gasket can withstand, see also how our silicone gasket is performing in the brochure "General Information and Theory". The products can also be obtained without gasket if none of our gasket options meet the requirements.

### Material description

Aluminium-zinc is a aluminium-zinc coated steel sheet that can be used unpainted up to corrosive class C4. See table on next page for information about corrosive classes.

The alloy of the metal coat has a weight percentage of 55% aluminium, 43.4% zinc and approx. 1.6 % silica with a coat weight of 185 g/m<sup>2</sup> per double side.

The surface has been treated with SPT (Surface Protection Treatment) to prevent stains during handling and to ease shaping.

### Appearance

The surface is initially glossy metal with a rose pattern but after some time it turns greyish, and eventually it becomes matt grey.

### Sheet steel properties

Aluminium-zinc coated steel sheet AZ185	According to EN 10327:2004
Fire Resistance Classification	A1 (EN 13501-1)

### Lifetime

The layer of aluminium-zinc has a thickness of approx. 25 µm (0.025 mm) per side for AZ185. The corrosive speed, i.e. how much of the coating that disappears each year, is a maximum of 0.2 µm in a normal environment (C2) in which aluminium-zinc is freely exposed.

In theory, it could therefore be evaluated that the lifetime in a normal environment exceeds 100 years. In tough marine environments, the corrosive speed can be up to 0.6 µm per year.

Due to corrosive and appearance related reasons, the following combinations should be avoided to prevent them from affecting the aesthetic and technical lifetime:

- Aluminium-zinc in combination with copper, brass or lead can cause galvanic corrosion. Avoid drainage from constructions and roofs that contain these metals. In particularly aggressive environments, even stainless steel and nickel can increase the corrosive speed of aluminium-zinc.
- Aluminium-zinc in contact with noble woods, damp wood or wood with waterproofing containing copper can cause black rust or corrosion.
- Aluminium-zinc in combination with bitumen products without a UV stabiliser.
- Aluminium-zinc in combination with wet concrete, cement and plastering that are very alkaline can cause discolouration or black rust.

### Trimming edges

Corrosion on the edges can occur in environments that are exposed to corrosion and in which the edges of the sheet are exposed. Normally, the trimmed edges do not need to be painted with a protective paint. Protective paint can be applied in environments in which the trimmed edges are aesthetically prominent.

## Corrosion

Aluminium-zinc has an ability to repair itself which makes the material resistant to corrosion caused by scratches. The long lifetime is due to the fact that the aluminium-zinc coating provides the steel sheet with a double protection against corrosion. The first protection factor is the coating on the steel sheet that forms a passivating barrier against general corrosion. The other protection factor involves the formation of a galvanic element when the sheet is exposed to moisture (electrolyte), resulting in zinc ions flowing over and protecting the exposed steel against corrosion in scratches or trimmed edges.

## Corrosive Class

Aluminium-zinc can be used up to corrosive class C4 in accordance with EN ISO 12944-2.

## Environment

The long lifetime of aluminium-zinc, in comparison with for instance hot dip galvanised sheets, entails major environmental benefits. There is a worldwide infrastructure for recycling steel that works well. Once steel is produced, it is part of a constant cycle as steel always contains recycled materials. Steel is always 100% recyclable, the metal layer does not pose any problems for remelting.

## Eurovent certification

Lindab's circular duct system with rubber gasket connections Lindab Safe and Lindab Safe Click is certified to strength and leakage in tightness class D according to the Eurovent Certified Performance program for circular metallic duct systems (DUCT-MC). Check ongoing validity of certificate:

[www.eurovent-certification.com](http://www.eurovent-certification.com)

The purpose of Eurovent third party Certification is to create a common set of criteria to all relevant features for the rating of products in this system and ensure the constancy of performance over time.

Through specification of products in Lindab's certified system, Lindab Safe and Lindab Safe Click, the engineer's tasks become easier, since there is no need to carry out detailed comparison and performance qualification testing. Consultants, specifiers and users can select products with the assurance that the catalogue data are accurate to a certain level.

Lindab products that are Eurovent certified have the Eurovent logotype in the footer of the technical documentation.

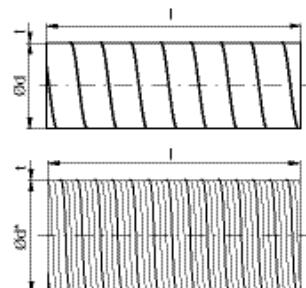

Note: Most Lindab Safe and Lindab Safe Click and the most commonly used product in a ventilation system are essentially better than class D, however some products are according to EN 15727 not class D as a single product. These products are stated in the documentation as Class C and can be used in D class systems to a limited extension.

## Corrosive classes in accordance with EN ISO 12944-2

Corrosive Class	Environmental Corrosivity	Examples of typical outdoor environments in the temperate climate zone (informative)
C1	Very low	Interior environments. Heated buildings with clean atmospheres, e.g. offices, shops, schools, hotels.
C2	Low	Atmospheres with low level of pollution. Mostly rural areas.
C3	Measurable	Urban and industrial atmospheres, moderate sulfur dioxide pollution. Coastal areas with low salinity.
C4	High	Industrial and coastal areas with moderate salinity.
C5-I	Very high (Industrial)	Industrial areas with high humidity and aggressive atmosphere.
C5-M	Very high (Marine)	Coastal and offshore areas with high salinity.

Most of us spend the majority of our time indoors. Indoor climate is crucial to how we feel, how productive we are and if we stay healthy.

We at Lindab have therefore made it our most important objective to contribute to an indoor climate that improves people's lives. We do this by developing energy-efficient ventilation solutions and durable building products. We also aim to contribute to a better climate for our planet by working in a way that is sustainable for both people and the environment.

[Lindab | For a better climate](#)
